

Building My Personal Portfolio Website

Arda Aydemir
Software Engineering
GISMA University, Berlin

20.06.2026

Summary

I created my own personal portfolio website. I used when i as doing this portfolio HTML, CSS and a little bit of JavaScript. First part is showing who i am, my skills and my education.

1 Introduction

I am a first-year Software Engineering student at GISMA University. I wanted a simple portfolio to introduce myself online. A portfolio website is useful because it works like an online business card, and i can share it when I am looking for internship. It also helps me practice the web development skills I am learning

2 Goals

Before I started, I wrote down a few simple goals:

- Show my profile, skills and education.
- Practise HTML and CSS.
- Give the page a nice, modern look.
- Keep the code simple.

3 Tools I Used

I only used standard web tools:

- **HTML** – for the structure and content of the page.

- **CSS** – for the colours, layout and design.
- **JavaScript** – for small things like the mobile menu and animations.
- **Google Fonts** – for the fonts.
- **Visual Studio Code** – I used to write the code.

4 How I Built It

The page has a few sections that you scroll through: a top part with my name and photo, an “about me” part, my skills, my education and a contact part. There is a menu at the top that takes you to each section when you click on it.

When I first started designing the website, I tried a few different colour combinations. At first I used a lighter background, but It was terrible how it looked. In the end I chose a dark background with bright colours because I thought it made the page look more modern and clear.

one of the parts I spent the most time on was making the website work properly on mobile phones. some section looked good on my laptop but did not display correctly on smaller screens everything mixed. after testing screen sizes, I used CSS media queries to adjust the layout and make the navigation easier to use.

I also added a little JavaScript so that the skill bars and text appear slowly as you scroll down the page.

5 Website Sections

- **First:** my name, what I am study and my photo.
- **About:** a short text about me and the tools I know.
- **Skills:** my programming skills and the languages levels and some software I use.
- **Education:** a timeline of my high schools up to GISMA University.
- **Contact:** my email, phone and location.

6 Problems and What I Learned

I had a few small problems while making the site:

- It was a bit hard because my first website portfolio. I learned to much thing for build website portfolio.
- My photo did not show at first because I wrote the file name wrong. I learned that file names have to match exactly.

- My photo is tall, so I used `object-fit: cover` to make it fit the frame without stretching.

7 Conclusion

At the beginning i did not think could build a website alone, but after finishing. It i was surprised how much I learned This was important achievement for me. I practised HTML, CSS and a little JavaScript, and I understand better how a web page is made. This is a good start for me.
